Submitted (21-AdG-1997) The Institute for Genomic Research, 9712

Medical Center Dr., Rockville, MD 20850, USA

BAC clone CIT987SK-9998 is located in band 12p15 of chromosome 12.

Genes were identified by a combination of five methods: XGRAIL

Gavailable by anonymous ftp from arthur.epm.ornl.gov), Genefinder

(available by anonymous ftp from colin@u.washington.edu), GENSCAN

(available by anonymous ftp from colin@u.washington.edu),

searches of the EST database at TIGR

(http://www.tigr.org/fdb/ndc/hcd.html) and searches against a

(http://www.tigr.org/fdb/ndc/hcd.html) and searches against a

peptide database. Repeats were identified using RepeatMasker (Smit,

A.F.A. and Green, P. unpublished,

http://ftp.genome.washington.edu/rm/RepeatMasker.html.

COMMENT

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences. ANNOTATION OF FEATURES: STSS are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

repeat_region

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.

QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found

http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.html.

Mamm	Dunn, M. Direct Submission		humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk COMMENT On Feb 1, 2002 this sequence version replaced gi:18151481.	During sequence assembly data is compared from overlapping clo Where differences are found these are annotated as variations	together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission	corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.	This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate

```

```
in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shorgun sequence reads. Both end sequences and whole genome shorgun sequence only contigs will be indicated in the feature table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    * NOTE: Estimated insert size may differ from sequence length

(see http://www.ngsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

* NOTE: This is a "working draft' sequence. It currently

* consists of 3 contigs. The true order of the pieces

is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

as soon as it is available and the accession number will

* be preserved.

Description

SEQ ID NO 27; 173pp; English.

The invention describes a method of diagnosing breast cancer in subject comprising contacting biological sample from subject with at least two different breast cancer-associated polypeptides (I) encoded by nucleic acid molecules (II) comprising sequence chosen from 42 fully defined sequences as given in specification, determining specific binding between (I) and agents in sample, where presence of the binding is diagnostic for breast cancer. The method is useful for diagnosing breast cancer in a subject. The sequence encodes a breast cancer in a first sequence encodes a breast cancer antigen.

WPI; 2001-457740/49. P-PSDB; ABB11822 Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis and cancer

Claim 1; Page 748; 1963pp; English.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA0925-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant bost cells comprising a nucleotide of the invention, methods of producing the nucleotides.

CC antibodies against the polypeptides, methods of deethifying compounds which bind to polypeptides in a sample, and methods of identifying compounds which prolypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence cc pipeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence cc potential therapeutic applications. The polypeptides of the invention may have various activities; send cell growth factor activity;

GIVING AND AND ACTIVITY, activity issue growth activity;

Immunomodulatory activities; receptor or ligand activities; or chemokinetic activities, has presented activities, or bemokinetic activities, neceptor or ligand activities or thrombolytic activities, receptor or ligand activities of the invention are useful for preventing, treating or anelorating medical conditions, e.g., by protein or gene therapy. Such conditions include and anormal activity and properties and inflammatory conditions (e.g., asthma or arthritis), arterial ischaemia, bone disorders (e.g., asthma or arthritis), arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal configurating (e.g., of burns, incisions and ulcers), while those with challed and funding cell and promote wound changed in growth, factor activity may be used to promote wound changed with growth factor activity may be used to promote wound configure activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disease or actidental damage. The presente sequence of promote cell growth factor activity may be used in the diagnosis of the above conditions, and indiance and nev novel human polypeptide of the invention

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a mucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                479 AAAcereAcreAcreAaAAAGeCACTACCTCTGCCTGCGACGCTATGGCTATGACTCGAAT

                       ABL22607;
The invention relates to an isolated polymucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polymucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (BST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA. The purified polypeptide is one of the 38043 isolated cDNA/BST sequences. Note: The sequence data for this patent did not form part of the printed specification, but was constant and an electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                  New polymucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA.

mammalian cells after stimulation with a ligand for a receptor tyrosine kinase found in oncogenic cells. The p62-dok protein binds p120 ras GTPase-activating protein (GAP). The p62-dok protein is involved in a signal transduction pathway initiated by receptor tyrosine kinase, and is rapidly tyrosine phosphorylated. The p62-dok protein is also present in romal cells, but is not constitutevily phosphorylated by normal receptor tyrosine kinase. Antibodies against p62-dok and aberrantly phosphorylated p62-dok, and probes derived from the p62-dok and aberrantly phosphorylated p62-dok, and probes derived from the p62-dok bNA sequence can be used in the diagnosis and treatment of conditions in which an oncogenic tyrosine

The present invention describes a predictor set comprising a plurality of polynucleotides or polypeptides whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein tyrosine kinase activity or members of the protein tyrosine kinase activity or members of the protein tyrosine kinase protein tyrosine kinase activity of cells, comprising obtaining a sample of cells, comprising obtaining a sample of cells, comprising obtaining a sample of cells, controlled the activity of the cells, comprising obtaining whether the cells express a plurality of markers, and correlate the activity of the cells, [2] a plurality of markers, and correlate with compound sensitivity or resistance of cells associated with a disease state, and [3] identifying polynucleotides and cells associated with a disease state, comprising subjecting the plurality of associated with a disease state, comprising subjecting the plurality or cell lines to one or more compounds, analysing the expression pattern of a microarray of polynucleotides that predict the sensitivity or cesistance of cells associated with a disease state by using the compounds that predict the sensitivity or cesistance of cells associated with a disease state by using the correstive pattern of the microarray. The polynucleotides and certain pattern of the microarray. The polynucleotides and certain tyrosine kinase pathways. These may be used in determining drug certainity of compounds that interact with protein tyrosine kinase pathways. These may be used in dividualized carrity by center profiles which aid in treating diseases and disorders (e.g. center) based on patient response at a molecular level. The present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              720 GACAAGGTCATGTÍCÍTÍTÍTCGAGGCCGGCCGCCGCTGCCCTCAGGCCCTGGAACCTÍC 779

The invention relates to an isolated polypeptide that comprises a sequence with 60 % sequence identity to one of 103 prostate specific colory polypeptide (PSP) sequences (S1), given in specification, or a sequence concoded by a nucleic acid comprising one of 114 prostate specific nucleic acid (PSNA) sequences (S2), given in specification. Also included are a cord comprising the PSNA, a host cell comprising the vector.

CC acid (PSNA) sequences (S2), given in specification. Also included are a preparation of the PSP, a polypeptide encoded by the PSNA; an anti-PSP cantibody the antibody or its fragment, a kit for detecting a risk of cancer in a patient, comprising a unit for and a vaccine comprising the PSP or the PSNA, The PSNA; a seaple of a patient of a prostate specific nucleic acid (PSNA) in a sample. The antibody to the PSP or the PSNA, The PSNA is useful for amplied the presence of a prostate specific nucleic acid (PSNA) in a cample. The antibody to the PSP is useful for determining the presence of a prostate cancer, where the administration of the antibody induces an immune response against the prostate cancer cell antibody induces an immune response against the prostate cancer in a patient. The PSP is useful as a vaccine component of relating a humoral and/or cellular immune response, and for prostate cancer in a patient. The PSP is useful as a vaccine component of conting transgenic animals and cells, and for producing transgenic animals and cells, and for producing ransgenic animals and cells, and for producing prostate cancer by detecting genetic lessons or mutations. The PSP and the PSNA is useful for staging and prostate cancer. The PSP and the PSNA are also useful for staging and prostate tissue and the antibody are useful for identifying prostate tissue and the antibody are useful in dispensing and prostate cancer. The PSP and the PSNA are also useful for identifying prostate tissue and the antibody are useful. The PSP and the PSNA are useful and and an entering and the antibody are useful and tra
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          diagnosing, monitoring, staging, imaging and treating prostate cancer and non-cancerous disease states in prostate tissue. The present sequence is a prostate specific nucleic acid (PSNA) sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    925 A; 1003 C; 1167 G; 714 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 3809 BP;

It is an example of claimed isolated nucleic acids (see AAZ94077-Z9413) that are specifically expressed in hematopoietic stem cells (HSCS) and which encode HSC-specific proteins. The HSCs are especially primitive HSCs (PHSCS) such as umbilical cord cells, bone marrow cells and foetal liver cells. The encoded proteins (see AAY9176-93) are growth factors, transcription factors, splicing factors, capping factors, transport proteins, translation factors or replication factors that modulate HSC
suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haemetopolesis regulating activity, tissue growth activity, activin/inhibin activity, chemotactic/chemokinetic activity, haemetostatic and thrombolytic activity, eceptor/ligand activity, anti-inflammatory activity, cabherin/tumour invasion suppressor activity, tumour inhibition activity. The polynucleotide may also be useful for
                                                                                                                                                                                                                                                                                                                                                                              GlyIlePheAlaPheLysCysAlaArgAlaGluGluLeuPheAsnMetLeuGlnGluIle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hematopoletic stem cell signaling proteins modulating replication and differentiation for treating immune system disorders and leukemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SA61; haematopoietic stem cell; immune system disorder; leukaemia; antileukaemic; immunomodulator; therapy; mouse; ss.

activity, especially differentiation or replication. The invention provides a claimed method for identifying PHSC-specific nuclaic acids involving: creating a PHSC conal library and a non-PHSC immune cell library; and subtracting the 2 libraries. Also claimed are methods: for generating a stem cell/progenitor cell from PHSCs; for identifying the presence of a PHSC in a sample; for identifying the presence of a compound that modulates HSC activity; for using such a compound to treat an immune system condition, especially leukaemia; for introducing exogenous nucleic acid into a HSC; and for ex vivo expansion of HSCs. Also claimed is a PHSC specifically expressing 1 of the claimed nucleic

The present sequence is that of a nucleic acid isolated from mouse primitive stem cells by a method of the invention. It is an example of claimed isolated nucleic acids (see AA294077-294131) that are example of specifically expressed in haematopoietic stem cells (HSCs) and which encode HSC specific proteins. The HSCs are especially primitive HSCs (PHSCs) such as umbilical cord cells, bone marrow cells and foetal liver cells. The encoded proteins (see AA79176-93) are growth factors, transport proteins, translation factors or replication factors, transport proteins, translation factors or replication. The invention provides a claimed method for identifying PHSC specific nucleic acids involving: creating a PHSC cDNA library and a non-PHSC immune cell involving: creating a PHSC cDNA library and a non-PHSC immune cell presence of a PHSC in a sample companied method for identifying PHSCs; for identifying the presence of a PHSC in a sample companied that modulates HSC activity; for using such a compound to treat an immune system condition, especially leukaemia; for introducing exceptous nucleic acid into a HSC; and for ex vivo expansion of HSCs. All and a chaimed mucleic acid into a HSC; and for ex vivo expansion of HSCs. All and a chaimed mucleic acid into a HSC; and for ex vivo expansion of HSCs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GluProvalvalGluArgAsnAsnHisGlnThrGluLeuGluValProArgThrProArg 124

The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression,

Novel nucleic acids and polypeptides, useful for treating disorders such as central nervous system injuries.

Claim 1; SEQ ID NO 4737; 10078pp; English.

The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic acitvity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous injuries, peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic collisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemoreatic/chemokinetic activity, haemostatic and thrombolyvic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification

                         Email: trop@sanger.ac.uk
This sequence is from a Xenopus Gene Collection (XGC) library
CDNS tructed by Aaron M. Zon.
CDNA was oligo dT primed from 5ug of poly A+ RNA from stages 10-13
gastrulae. ECORI-NotI cut CDNA was then ligated into pCS107 with
CocNI at the 5' end and NotI at the 3' end.
Vector: pCS107; Site 1: ECORI; Site 2: NotI
Host: Escherichia coli XLI-blue
